AUGMENTIN ES™
Amoxicillin trihydrate - Potassium clavulanate

QUALITATIVE AND QUANTITATIVE COMPOSITION

AUGMENTIN ES contains 600 mg amoxicillin (as amoxicillin trihydrate) and 42.9 mg clavulanic acid (as potassium clavulanate) per 5 ml, a 14:1 ratio.

PHARMACEUTICAL FORM

Strawberry cream flavour

Off-white powder with a characteristic strawberry odour, which, when constituted in water at time of dispensing, yields an off-white suspension.

CLINICAL PARTICULARS

Indications

AUGMENTIN should be used in accordance with local official antibiotic-prescribing guidelines and local susceptibility data.

AUGMENTIN ES is indicated for the treatment of paediatric patients with acute otitis media due to Streptococcus pneumoniae (penicillin minimum inhibitory concentration (MIC) less than or equal to < 2 µg/ml), Haemophilus influenzae (including beta-lactamase-producing strains) and Moraxella catarrhalis (including beta-lactamase-producing strains). Such patients are often characterised by antibiotic exposure for acute otitis media within the preceding 3 months, and are either aged ≤ 2 years or attend daycare.

Susceptibility to AUGMENTIN will vary with geography and time. Local susceptibility data should be consulted where available, and microbiological sampling and susceptibility testing performed where necessary.

Dosage and Administration

Paediatric patients 3 months and older:

The recommended dose for AUGMENTIN ES is 90/6.4 mg/kg/day in 2 divided doses at 12-hourly intervals for 10 days, (see chart below). There is no experience in paediatric patients weighing > 40 kg, or in adults. There are no clinical data on AUGMENTIN ES in children under 3 months of age.
### Body Weight (kg) vs Volume of *AUGMENTIN ES* providing 90/6.4 mg/kg/day

*AUGMENTIN ES* does not contain the same amount of clavulanate (as the potassium salt) as any of the other *AUGMENTIN* suspensions. *AUGMENTIN ES* contains 42.9 mg of clavulanate per 5 ml whereas *AUGMENTIN* 200 mg/5 ml suspension contains 28.5 mg of clavulanate per 5 ml and the 400 mg/5 ml suspension contains 57 mg of clavulanate per 5 ml. Therefore, *AUGMENTIN* 200 mg/5 ml and 400 mg/5 ml suspensions should not be substituted for *AUGMENTIN ES*, as they are not interchangeable.

**Hepatic Impairment**

Dose with caution; monitor hepatic function at regular intervals. There are insufficient data on which to base a dosage recommendation.

**Renal Impairment**

There are no dosing recommendations for *AUGMENTIN ES* in patients with renal impairment.

**Method of Administration**

To minimise the potential for gastrointestinal intolerance, *AUGMENTIN ES* should be taken at the start of a meal. The absorption of *AUGMENTIN* is optimised when taken at the start of a meal.

**Note:** SHAKE ORAL SUSPENSION WELL BEFORE USING.

**Contraindications**

*AUGMENTIN ES* is contra-indicated in patients with a history of hypersensitivity to beta-lactams, e.g. penicillins and cephalosporins.
**Warnings and Precautions**

Before initiating therapy with AUGMENTIN ES careful enquiry should be made concerning previous hypersensitivity reactions to penicillins, cephalosporins, or other allergens.

Serious and occasionally fatal hypersensitivity (anaphylactoid) reactions have been reported in patients on penicillin therapy. These reactions are more likely to occur in individuals with a history of penicillin hypersensitivity. If an allergic reaction occurs, AUGMENTIN ES therapy should be discontinued and appropriate alternative therapy instituted. Serious anaphylactoid reactions require immediate emergency treatment with adrenaline. Oxygen, intravenous steroids and airway management, including intubation may also be required.

Pseudomembranous colitis has been reported with the use of antibiotics and may range in severity from mild to life-threatening. Therefore, it is important to consider its diagnosis in patients who develop diarrhoea during or after antibiotic use. If prolonged or significant diarrhoea occurs or the patient experiences abdominal cramps, treatment should be discontinued immediately and the patient investigated further.

AUGMENTIN ES should be avoided if infectious mononucleosis is suspected since the occurrence of a morbilliform rash has been associated with this condition following the use of amoxicillin.

Prolonged use may also occasionally result in overgrowth of non-susceptible organisms.

Abnormal prolongation of prothrombin time (increased INR) has been reported rarely in patients receiving AUGMENTIN and oral anticoagulants. Appropriate monitoring should be undertaken when anticoagulants are prescribed concurrently. Adjustments in the dose of oral anticoagulants may be necessary to maintain the desired level of anticoagulation.

AUGMENTIN ES should be used with caution in patients with evidence of hepatic dysfunction. Hepatic toxicity associated with the use of amoxicillin/clavulanate potassium is usually reversible. On extremely rare occasions, deaths have been reported. These have generally been cases associated with serious underlying disease or concomitant medications.
In patients with renal impairment, dosage of **AUGMENTIN** should be adjusted according to the degree of impairment. No dosing recommendations can be made for **AUGMENTIN ES** in renally impaired patients (see **Dosage and Administration**).

In patients with reduced urine output, crystalluria has been observed very rarely, predominantly with parenteral therapy. During the administration of high doses of amoxicillin, it is advisable to maintain adequate fluid intake and urinary output in order to reduce the possibility of amoxicillin crystalluria (see **Overdose**).

**AUGMENTIN ES** contains aspartame (each 5 ml of suspension contains 7 mg of phenylalanine) and so should be used with caution in patients with phenylketonuria.

**Interactions**

Concomitant use of probenecid is not recommended. Probenecid decreases the renal tubular secretion of amoxicillin. Concomitant use with **AUGMENTIN ES** may result in increased and prolonged blood levels of amoxicillin but not of clavulanate.

Concomitant use of allopurinol during treatment with amoxicillin can increase the likelihood of allergic skin reactions. There are no data on the concomitant use of **AUGMENTIN ES** and allopurinol.

In common with other antibiotics, **AUGMENTIN** may affect the gut flora, leading to lower oestrogen reabsorption and reduced efficacy of combined oral contraceptives.

In the literature there are rare cases of increased international normalised ratio in patients maintained on acenocoumarol or warfarin and prescribed a course of amoxicillin. If co-administration is necessary, the prothrombin time or international normalised ratio should be carefully monitored with the addition or withdrawal of **AUGMENTIN**.

In patients receiving mycophenolate mofetil, reduction in pre-dose concentration of the active metabolite mycophenolic acid of approximately 50% has been reported following the commencement of oral amoxicillin plus clavulanic acid. The change in pre-dose level may not accurately represent changes in overall MPA exposure.

**Pregnancy and Lactation**

**Use in Pregnancy**

Reproduction studies in animals (mice and rats at doses up to 10 times the human dose) with orally and parenterally administered **AUGMENTIN** have shown no teratogenic effects. In a single study in women with preterm, premature rupture of the foetal membrane (pPROM), it was reported that prophylactic treatment with **AUGMENTIN** may be associated with an increased
risk of necrotising enterocolitis in neonates. As with all medicines, use should be avoided in pregnancy, unless considered essential by the physician.

**Use in Lactation**

Ampicillin-class antibiotics are excreted in human milk; therefore caution should be exercised when Augmentin is administered to a nursing mother. However, *AUGMENTIN ES* may be administered during the period of lactation. With the exception of the risk of sensitization, associated with the excretion of trace quantities in breast milk, there are no known detrimental effects for the breast-fed infant.

**Effects on Ability to Drive and Use Machines**

Adverse effects on the ability to operate machinery have not been observed.

**Adverse Reactions**

Data from large clinical trials were used to determine the frequency of very common to rare undesirable effects. The frequencies assigned to all other undesirable effects (i.e., those occurring at <1/10,000) were mainly determined using post-marketing data and refer to a reporting rate rather than a true frequency.

The following convention has been used for the classification of frequency :-

- very common >1/10
- common >1/100 and <1/10
- uncommon >1/1000 and <1/100
- rare >1/10,000 and <1/1000
- very rare <1/10,000.

**Infections and infestations**

Common: Mucocutaneous candidiasis

**Blood and lymphatic system disorders**

Rare: Reversible leucopenia (including neutropenia) and thrombocytopenia

Very rare: Reversible agranulocytosis and haemolytic anaemia. Prolongation of bleeding time and prothrombin time

**Immune system disorders**
Very Rare  Angioneurotic oedema, anaphylaxis, serum sickness-like syndrome, hypersensitivity vasculitis

**Nervous system disorders**

Uncommon  Dizziness, headache

Very Rare  Reversible hyperactivity and convulsions. Convulsions may occur in patients with impaired renal function or in those receiving high doses.

**Gastrointestinal disorders**

Common   Diarrhoea, nausea, vomiting

Nausea is more often associated with higher oral dosages. If gastrointestinal reactions are evident, they may be reduced by taking AUGMENTIN at the start of a meal.

Uncommon  Indigestion

Very Rare  Antibiotic-associated colitis (including pseudomembranous colitis and haemorrhagic colitis – see Warnings and Precautions). Superficial tooth discolouration has been reported very rarely in children. Good oral hygiene may help to prevent tooth discolouration as it can usually be removed by brushing.

Black Hairy Tongue

**Hepatobiliary disorders**

Uncommon  A moderate rise in AST and/or ALT has been noted in patients treated with beta-lactam class antibiotics, but the significance of these findings is unknown

Very Rare  Hepatitis and cholestatic jaundice. These events have been noted with other penicillins and cephalosporins.

Hepatic events have been reported predominantly in males and elderly patients and may be associated with prolonged treatment. These events have been very rarely reported in children.

Signs and symptoms usually occur during or shortly after treatment but in some cases may not become apparent until several weeks after treatment has ceased. These are usually reversible. Hepatic events may be severe and in extremely rare circumstances, deaths have been reported. These have almost always occurred in patients with serious underlying disease or taking concomitant medications known to have the potential for hepatic effects.

**Skin and subcutaneous tissue disorders**

Uncommon  Skin rash, pruritus, urticaria
Rare  Erythema multiforme

Very Rare  Stevens-Johnson syndrome, toxic epidermal necrolysis, bullous exfoliative-dermatitis, acute generalised exanthematous pustulosis (AGEP)

If any hypersensitivity dermatitis reaction occurs, treatment should be discontinued.

Renal and urinary disorders

Very rare  Interstitial nephritis, crystalluria (see Overdose)

Overdose

Gastrointestinal symptoms and disturbance of the fluid and electrolyte balances may be evident. Gastrointestinal symptoms may be treated symptomatically, with attention to the water/electrolyte balance.

Amoxicillin crystalluria, in some cases leading to renal failure, has been observed (see Warnings and Precautions)

AUGMENTIN ES can be removed from the circulation by haemodialysis.

A prospective study of 51 paediatric patients at a poison control centre suggested that overdosages of less than 250 mg/kg of amoxicillin are not associated with significant clinical symptoms and do not require gastric emptying.

PHARMACOLOGICAL PROPERTIES

Pharmacodynamics

Amoxicillin is a semisynthetic antibiotic with a broad spectrum of bactericidal activity against many gram-positive and gram-negative microorganisms. Amoxicillin is, however, susceptible to degradation by β-lactamases and, therefore, the spectrum of activity does not include organisms which produce these enzymes. Clavulanic acid is a β-lactam, structurally related to the penicillins, which possesses the ability to inactivate a wide range of β-lactamase enzymes commonly found in microorganisms resistant to penicillins and cephalosporins. In particular, it has good activity against the clinically important plasmid mediated β-lactamases frequently responsible for transferred drug resistance.

The clavulanate component in AUGMENTIN ES protects amoxicillin from degradation by β-lactamase enzymes and effectively extends the antibiotic spectrum of amoxicillin to include many bacteria normally resistant to amoxicillin and other β-lactam antibiotics. Thus, AUGMENTIN ES possesses the distinctive properties of a broad-spectrum antibiotic and a β-lactamase inhibitor.

In the list below, organisms are categorised according to their in vitro susceptibility to AUGMENTIN.
**In vitro** susceptibility of micro-organisms to **AUGMENTIN**

Where clinical efficacy of AUGMENTIN has been demonstrated in clinical trials this is indicated with an asterisk (*).

Organisms that do not produce beta-lactamase are identified (with †). If an isolate is susceptible to amoxicillin, it can be considered susceptible to **AUGMENTIN**.

The pharmacokinetics of the two components of *AUGMENTIN ES* are closely matched. Both clavulanate and amoxicillin have low levels of serum binding; about 70% remains free in the serum.

**Pre-clinical Safety Data**

No further information of relevance.

**PHARMACEUTICAL PARTICULARS**

**List of Excipients**

Strawberry cream flavour

*Powder for oral suspension*: colloidal silicon dioxide, sodium carboxymethylcellulose-12, strawberry cream flavour, xanthan gum, aspartame, and silicon dioxide.

**Incompatibilities**

None known.

**Shelf Life**

The expiry date is indicated on the packaging.
Special Precautions for Storage

The powder for oral suspension should be stored in a well sealed container, in a dry place at or below 25°C. Reconstituted suspensions should be stored in a refrigerator (2-8°C) and used within 10 days.

Nature and Contents of Container

*AUGMENTIN ES* powder for oral suspension, will be supplied as a dry powder suitable for reconstitution.

The dry powder is filled into glass bottles with aluminium caps with a PVC liner.

Not all presentations are available in every market.

Instructions for Use/Handling

At time of dispensing, the dry powder should be reconstituted to form an oral suspension, as detailed below:

Tap bottle until all the powder flows freely. Add approximately 2/3 of the total amount of water for reconstitution (see table below) and shake vigorously to suspend powder. Add remainder of the water and again shake vigorously.

<table>
